

Mladi Info – Android application

Antonio Ivanovski | antonioivanovski@gmail.com

Motivation and project initialization

- Wanted to do at least fairly simple app from start to the end
- Wanted to use new and trending technologies
- Made rough sketch how the app will look
- Rough app architecture

Features

	MladiInfo app	http://mladi.ams.mk/
Trainings	✓	✓
Work	✓	✓
Events	✓	✓
Organizations	✓	✓
Scholarships	✓	✓
Educational institutions	✓	✓
Discounts	✓	✓
Articles search	✓	✓
Offline data	✓	✗
Notifications	✓	✗

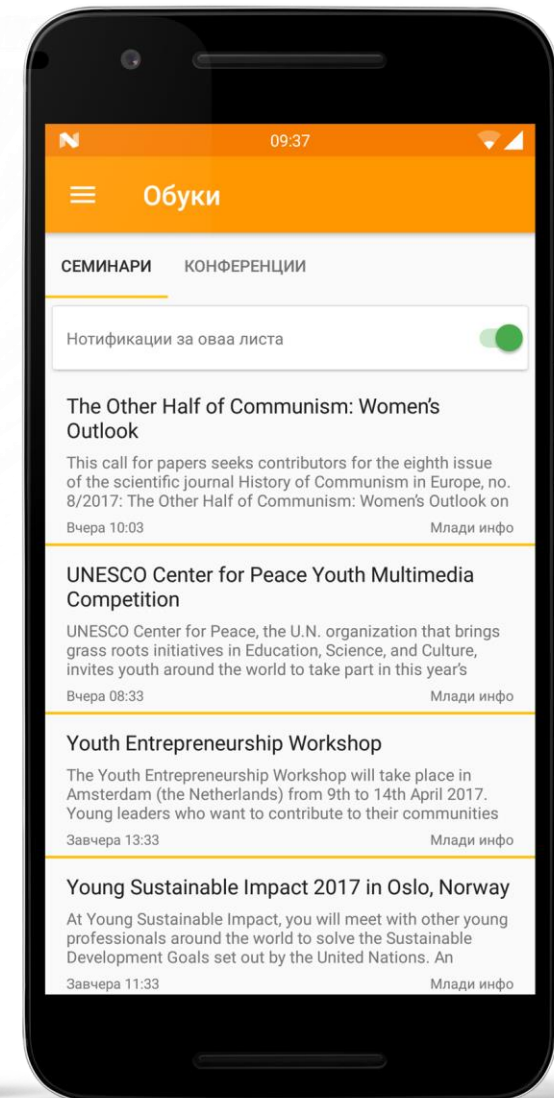

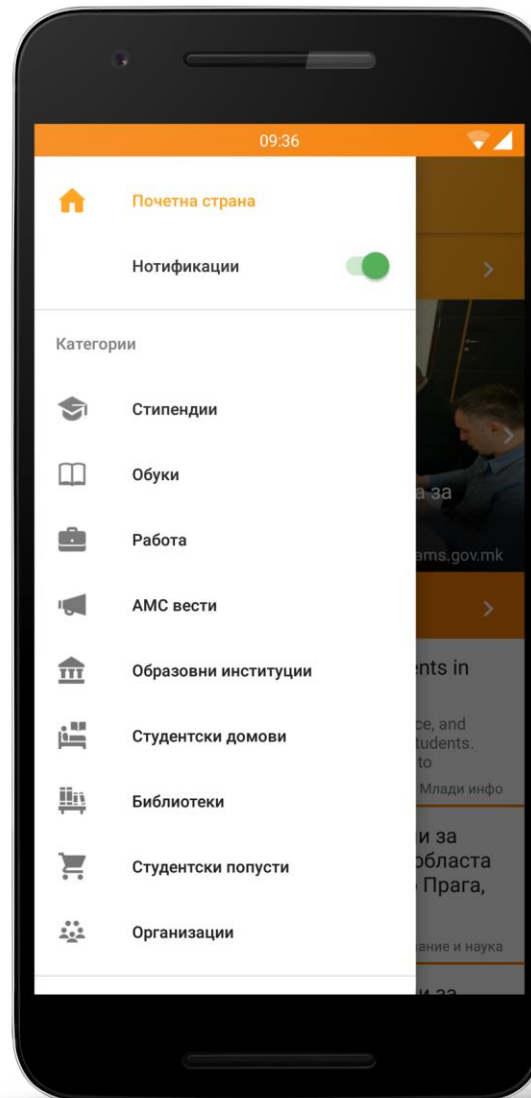

Design

- Based on mladi.ams.mk
- Material design
- Compatible with small and large displays

Navigation

- Navigation drawer – between categories
- Tab navigation – between subcategories in one category

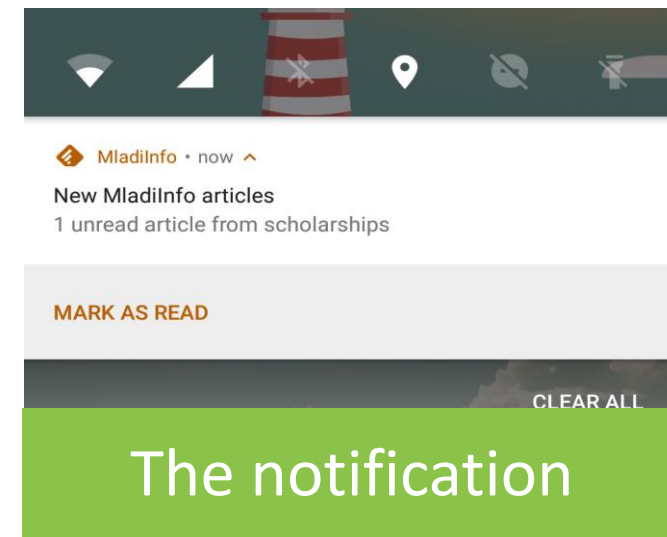

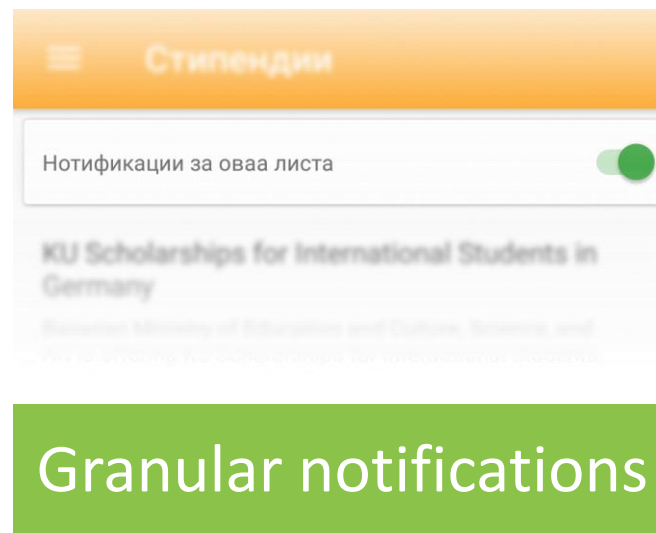

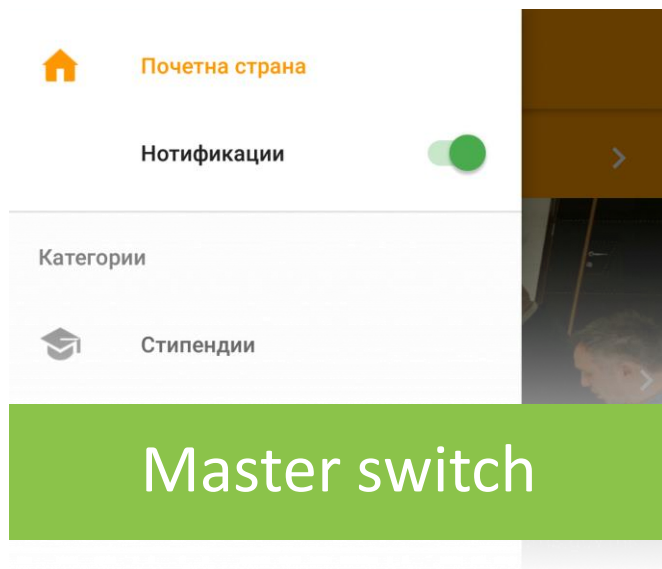

Overview page

- Quick overview of the latest articles
- Personalization of the categories to show

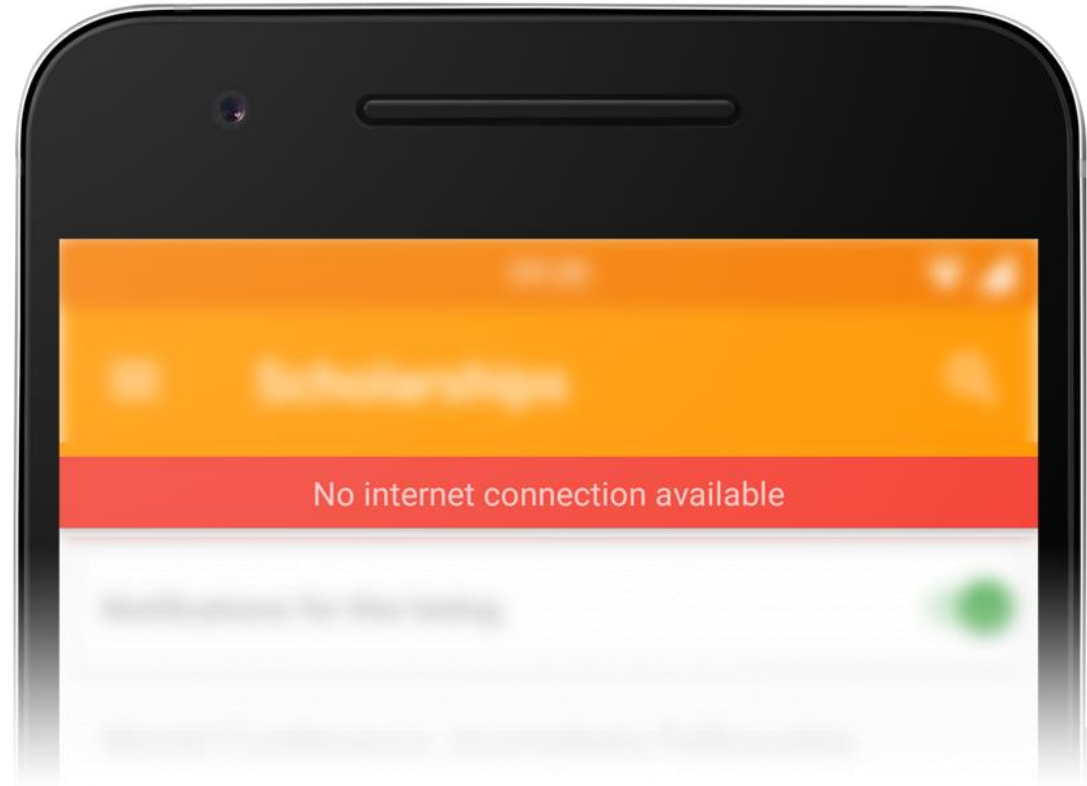

Notifications

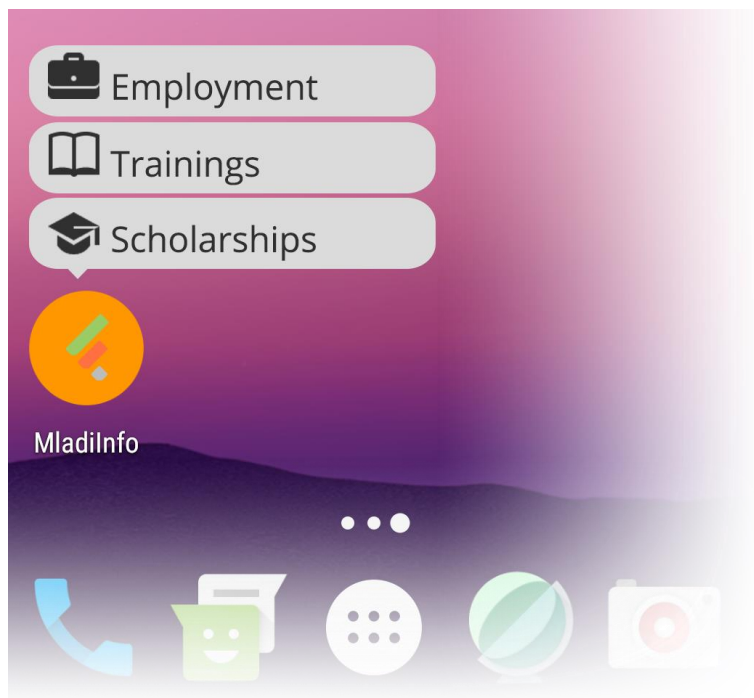

Offline data

- Used when no or slow internet connection
- Primary useful for contacts and locations

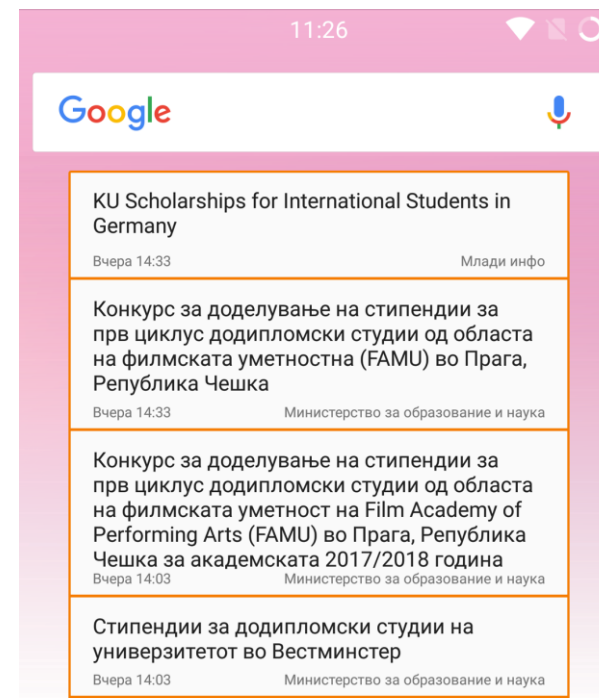

Future work

APP SHORTCUTS

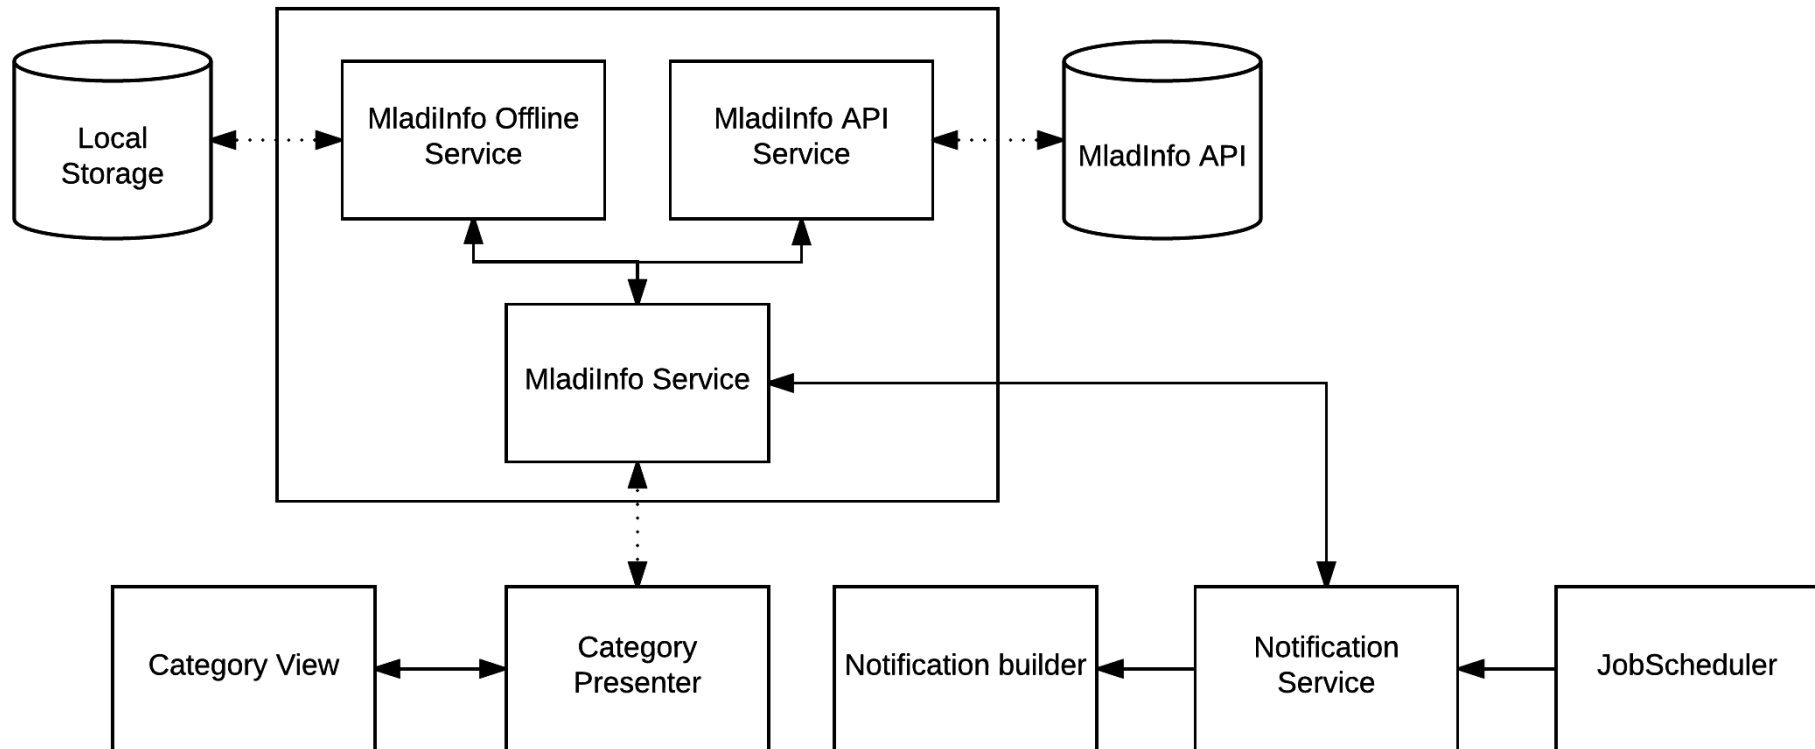

WIDGET

Technologies used

- Kotlin: Statically typed programming language for the JVM, Android and the browser
- Retrofit: Type-safe HTTP client for Android and Java by Square, Inc.
- Epoxy: Android library for building complex screens in a RecyclerView.
- Glide: Fast and efficient open source media management and image loading framework for Android.
- Icons8: Single icon pack with 38100 free icons. Each icon is in 5 flat styles. Download as PNG, SVG, or as a font
- Full implementation available on GitHub: github.com/toteto/MladiInfo

Basic architecture

Adding additional categories

```
class Category() {  
    // Category code here  
  
    class Factory {  
        fun getTrainingCategory() = Category()  
        .addSubcategory(  
            id = seminarId,  
            call = MladiInfoApi.getTraining(),  
            filter = { item.isSeminar },  
            bindData = { listAdapter.bindAricleItems(items) })  
        .addSubcategory(  
            id = conferenceId,  
            call = MladiInfoApi.getTraining(),  
            filter = { item.isConference },  
            bindData = { listAdapter.bindAricleItems(items) })  
    }  
}
```

Dynamic building of each category

Grouping of equal API requests

Filtering of the data response from the API

Custom data binding of each subcategory

Thank you for
your attention
